

Password control system, password control method, information processor and computer program

Abstract

(JP2003085143)

PROBLEM TO BE SOLVED: To provide a password control system capable of securely and efficiently controlling a pluratity of

SOLUTION: A master password is set as a superordinate password of the passwords set in an information processor, and coincidence of the master password is ventied at resetting or changing processing time of the respective passwords. The misster password is generated by cipner processing by applying a master key to device ID, and is not stored in a memory, and is generated when executing coincidence verifying processing. A support center is set for controlling the mester password, and is constituted so as to execute master password raissuing processing to reduce a burden of password control in a user.
